SUMMARY

Senior Data Architect for remote US contracts. I make the architecture call and implement it: Snowflake migrations with Data Vault 2.0, governed dbt estates, Azure Synapse modernization, FinOps guardrails, and weekly written delivery. No handoff gap between strategy and code.

EXPERIENCE

Quantiphi - Senior Data Architect

08/2025 - Present

- Led architecture for a global CRM/SaaS program migrating 10B+ records onto Snowflake with Data Vault 2.0 hubs, links, and satellites.
- Designed a six-week parallel-run cutover with external stages, idempotent Python loads, hash/row-count parity, and a rehearsed rollback window so finance reporting never went dark.
- Stood up GitHub Actions promotion gates and runbooks; guided a 70+ engineer coalition on lineage, warehouse sizing, and clustering for micro-partition pruning.
- Owned the target-state tradeoffs for platform vs analytics squads - marts stayed stable while source CRM keys kept changing underneath.
- Left the program with documented cutover playbooks, dashboard parity packs, and a platform team that could operate without a hero weekend.

Tredence - Data Architect

12/2021 - 12/2024

- Governed a 350+ model retail analytics dbt estate into staging -> intermediate -> marts with ownership tags and materialization standards.
- Implemented Slim CI, source freshness contracts, and test gates on every PR so broken changes died before the nightly SLA window.
- Right-sized Snowflake warehouses with auto-suspend/auto-scale profiles by workload class; incremental models and clustering cut queue time.
- Delivered 60% faster dbt model runs and 70% fewer production incidents on the same retail analytics program.
- Made deploys boring: Power BI marts stayed thin, Airflow orchestration stayed predictable, and squads stopped shipping circular refs.

Infosys - Data Engineer to Senior

06/2017 - 12/2021

- Modernized an enterprise finance warehouse on Azure Synapse - distribution-aware dimensional models tuned to the real join graph.
- Replaced nightly full reloads with ADF incremental watermark loads; failures became local instead of catastrophic.
- Shipped row-level security and Terraform-managed observability so audit and controllers shared the same control story.
- Improved query performance 4x and reduced infrastructure cost 25% while sustaining 99.9% platform SLA over 12 months.
- Cleared internal audit on first review with documented RLS, pipeline health boards, and Power BI regression packs.

SELECTED OUTCOMES

- 10B+ records migrated with zero reporting blackout (global CRM/SaaS program at Quantiphi).
- 70% fewer production incidents and 60% faster dbt runs (retail analytics estate at Tredence).
- 4x query speed, 25% lower cloud spend, 99.9% SLA (enterprise finance warehouse at Infosys).

CORE STACK

Snowflake | dbt | Databricks | Delta Lake | PySpark | Azure Synapse | ADF | Data Vault 2.0 | Airflow | Python | SQL | Terraform | GitHub Actions | Power BI | CI/CD | FinOps | RBAC | lineage

ENGAGEMENT

Available as an independent contractor for remote US work. Architecture decisions and hands-on delivery in the same engagement. Weekly written increments. US-hours overlap from Bengaluru. W-8BEN and tax paperwork on request.
